TITLE: Reactions to radiation and chemical protection of animals subjected to the effects of high-energy protons

SOURCE: Konferentsiya po aviatsionnoy i kosmicheskoy meditsine, 1963. Aviatsionnaya i kosmicheskaya meditsina (Aviation and space medicine); materialy konferentsii. Moscow, 1963, 510-514

TOPIC TAGS: corpuscular radiation, high energy proton, synchrocyclotron, gamma ray, radiation effect, radioprotective agent, RBE

ABSTRACT: Experiments were performed to determine the immediate and the delayed effects of high-energy protons and their RBE on animal organisms. High-energy protons of 660 Mev were generated on a synchrocyclotron. Comparative tests using gamma rays from a Co<sup>60</sup> source were used in establishing the RBE. Nonpure strain mice and rats were used, in addition to mice of the BALB and C-57BL strains.

Card

1/3 4

ACCESSION NR: A74042722

All materials were subjected to statistical analysis. In comparative experiments performed on rats subjected to a dose of 500 rad, the degree of injury to hemopoietic organs by protons was considerably less than injury caused by gamma radiation. The depression of hemopoiesis in the bone marrow and the spleens of animals irradiated by protons was less profound and less prolonged, and regenerative processes began earlier than in injuries produced by gamma rays. This difference of effect was particularly clear in the dynamics of the peripheral blood. After exposure to gamma irradiation, a profound and prolonged anemia developed, accompanied by a loss of 44% of the erythrocytes and 51% of the hemoglobin. An equivalent dose of protons caused only insignificant lowering of these indices. Similar effects were observed in the white blood corpuscles, particularly in respect to neutrophils. The results obtained confirm that the condition of peripheral blood does not reflect the true depth of radiation damage to hemopoiesis. In experiments with white mice, a study was made of early destructive changes in the brain marrow, the dynamics of mitotic activity, and the kinetics of cells with chromosomal injuries. Exposure to protons induced typical radiation degeneration of cells of the bone marrow, a slowing down of mitotic activity, and injuries to the chromosomes. A strong linear relationship of injury-to-dose was

Cord

2/5

ACCESSION NR: AT4042722

observed in all three indices within the 250--1000 rad range. Exposure to equivalent doses of gamma rays produced more pronounced changes, indicating that the RBE of protons is equivalent to 0.5--0.7. Preliminary administration of radio-protective agents -- AET (S,S'-aminoethylisothioronium), MEA (mercaptoethylamine), and 5-MOT(5-methoxytryptamine) -- diminished the number of degenerating and aberrant cells in the bone marrow in proportion to the effect of the indicated drugs on survival. The most effective appeared to be a combination of MEA and 5-MOT, whose use assured the survival of 50% of the mice when irradiated by doses of 1900 rad. If irradiation is fractionated, the protective effect of the drugs is reduced sharply, or it disappears altogether. In experiments on male mice of the BALB strain subjected to doses of 500 and 700 rad, reversible changes were observed in the weight of testicles. The change of weight and its subsequent recovery was due to the death and the subsequent regeneration of germ cells. Protons have a typical sterilizing effect on the genitalia, but their RBE, in comparison with gamma rays, lies between 0.6 and 0.7. The use of antiradiation drugs did not prevent the sterilizing action of protons, but it caused a somewhat smaller loss of weight of the testicles and produced a shorter period of sterility. White male mice which had been protected by AET, MEA, 5-MOT, and cystamine from the effects of proton doses of 1300--1600 rad recovered their generative functions

Card 3/5

ACCESSION NR: AT4042722

almost completely four to seven months after irradiation. The development of the first generation of 290 mice obtained by crossing the protected and irradiated males with intact females took place without visible somatic injuries. The relative effectiveness of protons and gamma rays in causing somatic mutations was studied on livers of white rats who were subjected to doses of 150 rad. Regeneration of the liver was induced by removing the large left and the front right lobes of the liver. The operation was performed 24 hours after irradiation. The animals were killed 30 hours after the operation, i. e., during the first wave of the increase of mitotic activity. Control animals had 6.9% of aberrant cells, while after irradiation by protons and gamma rays, the number of aberrant cells was 20% and 25%, respectively. This indicates that the RBE of protons in respect to somatic mutations is around 0.7. New data were obtained on the blastomogenic effect of protons. Out of 85 irradiated rats, tumors were found in 39. Twenty-five of them had multiple tumors in various locations. In experiments on non-pure strain white mice, it was possible to show that antiradiation drugs, while increasing the radio resistance of the animals, do not prevent subsequent development of new growth. Out of 65 irradiated mice who died at various periods after exposure to protons in doses from 1300 to 1500 rad (after having previously received antiradiation protection), fourteen had leucosis and four had sarcoma.

TITLE: Cytological analysis of the effects of high energy protons. III. Dose dependence and the dynamics of chromosomal aberrations in the bone marrow of mice irradiated with 660-Mev protons and Co<sup>60</sup> gamma rays

SOURCE: Radiobiologiya, v. 5, no. 2, 1965, 275-278

TOPIC TAGS: gamma radiation, high energy proton, biological effect, cytology, bone marrow, chromosomal aberration, mitosis

ABSTRACT: The authors compared the cytological effects of various doses of 660-Mev protons and Co<sup>60</sup> rays. White male mice weighing 20-22 g were exposed to single proton doses of 250, 500, 800, and 1000 r. Animals were killed 12, 24, 48, and 96 hr after irradiation. A total of 137 animals including the controls were used. Results are given in Table 1 and 2 of Enclosure. It was concluded that 660-Mev protons inhibit bone-marrow mitosis, as reflected by cells with chromosomal injury such as bridges and acentric fragments. The level of mitotic inhibition and the number of cells with chromosomal aberrations depend linearly on the dose absorbed. The RBE of protons compared to gamma rays was determined to be 0.65. Orig. art. has: [CD]

TITLE: Mechanism of injury and shielding of the bone marrow of animals against proton and x ray irradiation / Paper presented at the Conference on Problems of Space Medicine held in Moscow from 24-27 May 1966/

SOURCE: Konferentsiya po problemam kosmicheskoy meditsiny, 1966. Problemy kosmicheskoy meditsiny. (Problems of space medicine); materialy konferentsii, Moscow, 1966, 387-388

TOPIC TAGS: ionizing radiation biologic effect, proton radiation biologic effect, relative biologic efficiency, hematopoiesis, radiation tissue effect, bone marrow

ABSTRACT:

Experimental data were obtained on the kinetics of radiation injury to bone marrow in mice. Animals were irradiated with x-rays and high-energy protons in doses of 250-700 rem. Interstage death of cells, chromosome aberrations and delayed cell division were evaluated as factors contributing to radiation injury. Quantitative cytological analysis showed that bone marrow destruction in the first few days after irradiation was

Card 1/3

L 08835-67

ACC NR: A13036685

largely due to delayed cell division, combined with a normal rate of ejection of formed blood elements into the sanguiferous lumen. In the range of lethal and sublethal doses used, bone marrow destruction occurred exponentially, regardless of dependence on dose value of protective agents.

It was found that interstage death and chromosome injuries do not essentially alter the bone-marrow destruction rate, but they do determine the outcome of radiation injury, since they characterize the cellular balance of hemogenic organs and the degree of leukopenia in the period 3-4 days after irradiation. Neutrophil leukocytosis observed immediately after irradiation was caused by the necessity of removal of cellular detritus (formed in large amounts by the mass interstage death of cells).

Radioprotectors work by weakening all types of radiation injury to cells. They have a lesser or negligible effect on the kinetics of initial bone-marrow destruction. The protective effect is manifested by the beginning of regeneration, which is facilitated for protected animals because of the existence of a stock of undamaged hemogenic cells. The number of these undamaged cells with all radiation doses exceeds the number in unprotected control animals by 40%. This is caused by the difference in recovery rate.

Card 2/3

ACC NR: A16036685

for mitotic activity and by the difference in quality of mitoses. On the basis of experimental data, methods of search for new radioprotectors and methods of early therapy for acute radiation sickness were discussed.

TITLE: Cytological analysis of the effect of high-energy protons: Part 2. Effect of S,Beta-aminoethylisothiuronium (AET) on cell destruction, mitosis, and chromosome aberrations in the bone marrow of mice subjected to total-body irradiation by 660-Mev protons

SOURCE: Radiobiologiya, v. 3, no. 3, 1963, 453-455

TOPIC TAGS: high-energy protons, 660-Mev protons, radioprotective agents, S,Beta-aminoethylisothiuronium, AET, radiogenic cellular degeneration, radiogenic mitotic activity increase, radiogenic chromosome damage

ABSTRACT: Combined effects of 660-Mev protons and AET (S,Beta-aminoethylisothiuronium) on bone-marrow cells of white mice were investigated at the Ob'yedinennyi institut yadernykh issledovaniy (Joint Institute of Nuclear Research) by personnel of the Institut gigiyeny truda i profzabolevaniy (Institute of Industrial Hygiene and Occupational Diseases). Administration

Card 1/2

ACCESSION NR: AP3001073

to male mice weighing 20 to 23 g of 3 mg of AET bromide, hydrobromide 5 to 10 min before total-body irradiation with 1000 rad resulted in a significant decrease in the frequency of radiogenic cellular degeneration in bone-marrow cells, an increase in mitotic activity, and a decrease in the number of cells showing radiogenic chromosome damage as compared to irradiated controls which did not receive AET. The beneficial effect of AET on the processes of cell division in the bone marrow indicate that AET is an effective radioprotective agent capable of increasing survival rates following irradiation by high-energy protons. TITLE: The Effect of Some Ions on the Precipitation of  
Uranyl Ferrocyanide From Aqueous Solutions

PERIODICAL: Zhurnal analiticheskoy khimii, 1960, Vol 15, Nr 1,  
pp 77-83 (USSR)

ABSTRACT: The effect of some ions on the composition of  
the precipitate formed by the reaction of uranyl  
ion with ferrocyanide was studied, using amperometric  
titration. Titration was conducted in 1 M potassium  
nitrate solution at pH 3.0-5.0 and 40-60°. According  
to the effect on uranyl ferrocyanide precipitation,  
the investigated elements form the following groups.  
Ions which do not effect the composition of uranyl  
ferrocyanide:  $\text{NH}_4^+$ ,  $\text{Na}^+$ ,  $\text{Mg}^{2+}$ ,  $\text{Al}^{3+}$ ,  $\text{Cr}^{3+}$ ,  $\text{Ce}^{3+}$ ,  
 $\text{VO}_3^-$ ,  $\text{CrO}_4^-$  and  $\text{Cl}^-$ ; ions which change the composition

Kutateladze, S. S., ed.

Heat and mass transfer and friction in a turbulent boundary layer (Teplomassobmen i treniya v turbulentnom pogranichnom sloye) Novosibirsk, Redizdat Sib. otd. AN SSSR, 1964. 206 pl illus., biblio. Errata slip inserted. 1000 copies printed. (At head of title: Akadmeiya nauk SSSR. Sibirskoye otdeleniye. Institut teplofiziki) Editor: L. I. Shpakovskaya; Technical editor: Ye. G. Shmakova; Proofreader: L. I. Korshunova

TOPIC TAGS: boundary layer flow, detached flow, friction, heat transfer, incompressible fluid, mass transfer, nonisothermal flow, radiation effect, turbulent boundary layer

PURPOSE AND COVERAGE: This book is a continuation of the monograph by S. S. Kutateladze and A. I. Leont'yev, published in 1962, in which certain properties of the limiting laws of friction and heat transfer in the turbulent boundary layer on a solid were formulated and specific applications of these laws were analyzed. The basic portion of the book was written by Kutateladze and A. I. Leont'yev.

N. A. Rubtsov was mainly responsible for the development of problems of the interaction of the turbulent boundary layer with radiation. The theory of the flow structure beyond the region of detachment was developed by M. A. Gol'dshtik. Others who helped prepare the book were N. N. Kirillova, B. P. Mironov, V. A. Kukhin, N. V. Mukhina, A. K. Rebrov, V. K. Fedorov, M. V. Davydova, S. A. Druzhinin, E. P. Volchkov, Ye. M. Khabakhpasheva, I. G. Malenkov, V. N. Moskvicheva, and L. S. Shtokolov. Professor D. B. Spolding helped in the analysis of certain interesting questions.

AUTHOR: Shmakova, Z. A.

TITLE: Investigation of the Infrared Absorption Spectra of Three Nitroaniline Isomers (Issledovaniye infrakrasnykh spektrov pogloshcheniya trekh izomerov nitroanilina v rastvorakh)

PERIODICAL: Izvestiya Vysshikh Uchebnykh Zavedeniy, Fizika, 1958, Nr 6, pp 171-172 (USSR)

ABSTRACT: The paper reports measurements of the infrared absorption spectra of three nitroaniline isomers, of aniline and nitrobenzene in the region 2.5-10  $\mu$ . These substances were studied as solutions in dioxane and  $\text{CCl}_4$  in order to elucidate the nature of interaction of the atomic groups  $\text{NH}_2$  and  $\text{NO}_2$  with each other and with the benzene ring. The three nitroaniline isomers were chemically pure and their melting points were 71.0 (ortho), 113.6 (meta) and 146.5°C (para-nitroaniline). The solvents used were also pure and their boiling points were 77.6 ( $\text{CCl}_4$ ) and 101°C (dioxane). The absorption spectra were recorded by means of an infrared spectrometer IKS-11. The solution concentrations were from

Card 1/3 0.003 to 1.5 mole/litre and the thickness of the absorbing

SOV/139-58-6-28/29

Investigation of the Infrared Absorption Spectra of Three Nitroaniline Isomers

layer was from 0.5 to 0.01 mm. The results are given in Tables 1 and 2. The author compares her own and published data (Refs 1,2,5) and draws the following conclusions:

1. Association between nitroaniline molecules occurs at room temperature. This is indicated by splitting of the  $3.09 \mu$  band, which is due to deformational vibrations of the  $\text{NH}_2$  group, into two components at  $3.14$  and  $3.24 \mu$ .
2. Changes in the frequencies of the fundamental vibrations of the  $\text{NO}_2$  group suggest: (a) existence of intramolecular hydrogen bond in o-nitroaniline dissolved in  $\text{CCl}_4$ , and (b) association between nitroaniline molecules of the three isomers in  $\text{CCl}_4$  solutions. The last conclusion is supported also by splitting of the absorption band in the region of  $7 \mu$  due to the symmetrical vibrations of the  $\text{NO}_2$  group.

Card 2/3      3. Splitting of the  $7.35 \mu$  band, due to symmetrical vibrations of the  $\text{NO}_2$  group, was observed in solutions of p-nitroaniline in dioxane. This splitting is

SOV/139-58-6-28/29

Investigation of the Infrared Absorption Spectra of Three Nitroaniline Isomers

probably due to association of p-nitroaniline molecules. This conclusion agrees with Bobovich's data (Ref 4).

4. Displacement of the  $6.55 \mu$  band towards longer wavelengths observed in solutions of o- and p-nitroaniline in dioxane is ascribed to the existence of the conjugation effect in these isomers. Acknowledgments are made to V. I. Danilova who directed this work and N.A. Prilezhayeva for her advice.

There are 2 tables and 4 references, 1 of which is Soviet and three English.

TITLE: On the nature of intra- and intermolecular interactions of NO<sub>2</sub>, NH<sub>2</sub>, and OH-groups in aromatic compounds

PERIODICAL: Referativnyy zhurnal, Fizika, no. 7, 1961, 135, abstract 7V266  
("Dokl. Mezhvuz. nauchn. konferentsii po spektroskopii i spektr. analizu", Tomsk, Tomskiy un-t, 1960, 90 - 91)

TEXT: Electronic and vibration absorption spectra of solutions of several substituted of benzene containing groups NO<sub>2</sub>, NH<sub>2</sub> and OH are compared with Raman spectra of these compounds. It is shown that in view of specific features of the mentioned substituting groups, possessing both donor and acceptor properties, in the investigated molecules and solutions take place very complicated processes of intra- and intermolecular interactions, among which should be singled out the effects of conjugation, hydrogen bonds and associations. Characteristic spectroscopic marks are established indicating the presence, in every particular case, of one or another type of intra- and intermolecular interactions.

Refracto-viscometric modification of the blood serum of dogs during experimental alcoholization. D. D. Shmal'. *Mtd. expl.* (Ukraine) 1936, No. 6, 101-8. — Expts. were performed on 8 male and 2 female dogs. From 6 to 10 g. of abs. alc. per kg. body wt. were administered per os (in proper dilns.) 2-3 times per week. Blood was taken 1.5-2 hrs., 4-5 hrs. and 24 hrs. after the alc. administration. There was an immediate increase in the serum refraction coeff. ( $n_D$ , by Abbe's refractometer), the viscosity coeff. ( $\eta$ , detd. by a viscometer according to Hess), the relative serum globulin content, and in the relative fluid vol. of the blood. These returned to normal after 24 hrs. During prolonged alcoholization there was a gradual progressive increase in  $n_D$  and  $\eta$ . The control dogs (receiving the same quantities of water instead of alc.) showed no regular variations in the above factors. S. therefore disagrees with Furth's view that small doses of alc. are stimulating.

AUTHOR SCHMALHAUSEN, O.I. 20-1-60/64  
 TITLE On the Formation of Deficient Organs of Smell in Species of Sturgeons in Their Artificial Breeding.  
 (Obrazovaniye defektnykh obonyatel'nykh organov u osetrovnykh ryb pri ikh iskustvennom razvedenii - Russian)  
 PERIODICAL Doklady Akademii Nauk SSSR, 1957, Vol 114, Nr 1, pp 216-219 (U.S.S.R.)  
 ABSTRACT It has been stated several times in relevant scientific papers that a number of anomalies can be found in the fry of species of sturgeons at their artificial breeding. The paper under review investigates the causes of these deficiencies. Experiments were carried out both in a station for the artificial breeding of fish and in a laboratory. The laboratory experiments concentrated in particular on the reactions of the fry to unfavorable aeration conditions. It was discovered that the percentage of specimens with deficient organs of smell is small. On the other hand, it was observed that the fry which had been taken from the same fish-pond and which was developed in Chalikov's apparatus, when brought into the river, i.e. into free current, showed a relatively larger number of specimens with deficient organs and this in spite of the higher saturation with oxygen of the water. The cause for this phenomenon was the toxicity of some metal parts of the apparatus (charts 1 and 2). Still other investigations were carried out and led to the conclusion that in specimens which can develop completely freely, i.e. under natural conditions, anomalies are an exception. (4 charts).

TITLE: A Photographic Method for Studying Random Processes

PERIODICAL: Priory i tekhnika eksperimenta, 1959, Nr 4, pp 144-145  
(USSR)

ABSTRACT: If the random quantity can be represented electrically, then a CRO tube can conveniently be used to determine its probable density. Let a random signal  $\xi(t)$  be applied to the X-plates and let  $x(t)$  be the corresponding beam deflection. The time during which the beam remains between  $x$  and  $x + \Delta x$  is proportional to the probability density  $W(x)$ . If another random signal  $\eta(t)$  is applied to the Y-plates then the time during which the beam lies between  $x$ ,  $x + \Delta x$  and  $y$ ,  $y + \Delta y$ , is proportional to  $W(x, y)$ , which is the 2-dimensional distribution of the quantities  $\eta(t)$  and  $\xi(t)$ . If the two signals are independent then  $W(x, y) = W(x)W(y)$ . It was shown in Ref 1 that if the excitation and decay of the light produced in the phosphor is independent of the number of excitations then the intensity on the screen is given by  $I(x, y) = AW(x, y)$ . If the intensity is measured at each point on the screen the 2-dimensional distribution is obtained. In the present method

TITLE: The Use of an Electrodynamic Instrument in a Correlator

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Radiofizika,  
1959, Vol 2, Nr 2, pp 318 - 320 (USSR)

ABSTRACT: A coil lies in the field of two coils supplied with the signal and a delayed version of it. An auxiliary coil driven by an amplifier is able to restore the deflected coil to its original position. An optical pick-off measures coil position. The inertia of the system and the magnitude of the restoring torque enable the low-pass filter properties of the system to be controlled. The mean-square error in the measurement depends on the ratio of the correlation time  $T_K$  of the random process to the effective averaging time of the filter  $T_u$ , given by the second equation on p 319. Figure 1 is a diagram of the arrangement. The input amplifiers  $d$  are shown in more detail in Figure 2. The pair of function coils are 2, the output coil 1, the compensating coil is 3, 4 is the pick-off mirror,

TITLE: Measurement of the probability distribution of the instantaneous values of signals by means of amplitude discriminators

PERIODICAL: Moscow Universitet. Vestnik. Seriya III. Fizika,  
astronomiya, no. 6, 1961, 25 - 31

TEXT: The principle of operation and the designs of two-channel and multi-channel amplitude discriminators are presented. Determination of the probability distribution by an amplitude discriminator is based on measuring the time during which the signal in question does not exceed a given level. The discriminator trims the signal to the desired level and delivers a certain impulse for every section of the signal that lies under the set level. Subsequently, the impulses are time-averaged by a separate device. Fig. 3 shows a 16-channel amplitude discriminator with a threshold given by  $U_{n+1/2} = \Delta U(n + 1/2)$  where

$n = -8, -7, \dots, -1, 0, +1, \dots, +6, +7$ . The instruments  $\Pi P_{-7\frac{1}{2}}$ ,  $\dots$ ,  $\Pi P_{7\frac{1}{2}}$  indicate the integral probability distribution if the switches  $\Pi_4$  are in position (1), and indicate the differential probability distribution if the switches are in position (2). The described device allows determination of the probability distribution at 16 equidistant points that are symmetric about zero. Signals from the frequency range 50 to 10,000 cps may be investigated. The time of averaging may go down to 500 sec. The accuracy is 10%. A similar two-channel amplitude discriminator for the frequency range 0 - 2000 cps is also described. There are 6 figures and 4 Soviet references.

TITLE: Certain stationary problems of dynamic programming

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniye  
tekhnicheskikh nauk. Energetika i avtomatika, no.5,  
1962, 131-139

TEXT: The article considers certain optimal servosystems in the presence of random forces from the point of view of Bellman's dynamic programming. The problem of applying this method to a continuous system or model is considered, where the input can be considered to be an n-dimensional Markov process. The analysis is based on the penalty function as the quality criterion. The risk is defined as the mathematical expectation of the penalty over a certain time interval. In systems with fixed parameters and signal characteristics, the risk will depend only on the duration of the interval and not on the time explicitly. A general expression for the minimum risk is given in symbolic form and it is stated that its solution is difficult except for one-dimensional problems. ✓B

TITLE: Fume removal from electric arc furnaces

SOURCE: Hutnicke listy, no. 2, 1966, 93-97

TOPIC TAGS: arc furnace, gas filter, metallurgic machinery, metallurgic process, gas engineering

ABSTRACT: The basic principles of the problem are described. The methods for the removal of waste gases, the selection of a filtration station for these gases, the temperature and the combustion properties of these gases are discussed. Methods for additional combustion of ingredients of such gases are described; cooling of such gases, and a heat accumulator are discussed. Suitable furnace pressures are evaluated. Differences between the usual Czechoslovak processes, and the technological aspects of foreign processes are discussed. Orig. art. has: 5 figures. [Based on authors' Eng. abstract] [JPRS: 34,779]
